

# The Development of Statistical Design and Analysis Concepts at Rothamsted

a British perspective on the history of statistics in agricultural research

Roger Payne,

VSN International, Hemel Hempstead, Herts, UK  
(and Rothamsted Research, Harpenden, Herts UK).

email: [Roger.Payne@vsni.co.uk](mailto:Roger.Payne@vsni.co.uk)

ROTHAMSTED  
RESEARCH

# 100 years ago

- significance test (Arbutnot 1710)
- Bayes theorem (Bayes 1763)
- least squares (Gauss 1809, Legendre 1805)
- central limit theorem (Laplace 1812)
  - distributions of large-samples tend to become Normal
- "Biometric School" Karl Pearson, University College
  - correlation, chi-square, method of moments
- t-test (Gosset 1908)
- Fisher in *Stats Methods for Research Workers*
  - "..traditional machinery of statistical processes is wholly unsuited to the needs of practical research. Not only does it take a cannon to shoot a sparrow, but it misses the sparrow!"

••

# Rothamsted

- Broadbalk – set up by Sir John Lawes in 1843 to study the effects of inorganic fertilisers on crop yields
- had some traces of factorial structure, but no replication, no randomization and no blocking
- and not analysed statistically until 1919..

# Ronald Aylmer Fisher

- in 1919 Rothamsted Director John Russell was faced with "great files of records"
  - looked for a "young mathematician ... prepared to examine our data and elicit further information"
- obtained a reference from Fisher's tutor at Caius College Cambridge
  - The answer was that he could have been a first class mathematician had he "stuck to the ropes" but he would not.
- conclusion
  - That looked like the type of man we wanted, so I invited him to join us. I had only £200, and suggested he stay as long as he thought that should suffice. ... It took me a very short time to realise that he was more than a man of great ability, he was in fact a genius who must be retained. So I set about obtaining the necessary grant.
- Fisher was at Rothamsted from 1919-1935.

# William Sealy Gosset

Photo from the MacTutor  
History of Mathematics  
archive (John J O'Connor  
and Edmund F Robertson)  
[http://www-groups.dcs.st-  
and.ac.uk/~history/](http://www-groups.dcs.st-and.ac.uk/~history/)

- worked at Guinness in Dublin
  - published under the pseudonym "Student"
  - devised the t-test (Biometrika 1908)
- approved of Fisher's appointment at Rothamsted
  - "there should be lots of interesting work to be done there and they might easily have got someone there who would have been worse than useless"
- had a long collaboration and correspondence with Fisher
  - .. but when I come to "Evidently" I know that means at least two hours hard work before I can see why (see J.F. Box, p.115)

..

# t-test

- originally derived empirically by Gosset
  - test for small samples that sample mean  $m = \mu$
  - if we use sample estimate of s.e. instead of  $\sigma$  cannot assume  $m - \mu$  will still have a Normal distribution
- caused Fisher to recognise concept of degrees of freedom
  - estimate s.e. by  $\sqrt{\{(x - m)^2 / (n - 1)\}}$  with divisor  $n - 1$  not  $n$
- Fisher (1922) Goodness of fit of regression formulae and distribution of regression coefficients. *J. Roy. Statist. Soc.*  
(1925) Applications of Student's distribution. *Metron*  
gave full mathematical justification & generalized to
  - differences between means
  - coefficients in regressions and multiple regressions
  - or any statistic of form Normal/ $\sqrt{\text{Chi-square}}$
  - and provided an expansion of the cumulative distribution formula of the distribution in inverse powers of  $n$ , together with some tables

••

In Table III is shown the analysis of the variation into these four classes; the mean square deviation is found by dividing the sum of squares in each class by the number of degrees of freedom, while the standard deviation is shown in the last column. When this value is significantly greater than the standard deviation of the differences between parallel plots, we may conclude that the corresponding effect is not due to chance.

Table III.

Variation due to	Degrees of freedom	Sum of squares	Mean square	Standard deviation
Manuring ... ..	5	6,158	1231.6	35.09
Variety ... ..	11	2,843	258.5	16.07
Deviations from summation formula	55	981	17.84	4.22
Variation between parallel plots ...	141	1,758	12.47	3.53
Total	212	11,740	—	—

In comparing the standard deviations in the last column we may use the fact that 3.53, for example, has the same accuracy as if it had been determined from a sample of 142; the variance of its natural logarithm is therefore  $\frac{1}{2 \times 141}$ . Thus, to test if the deviations from the summation formula are significantly greater than would occur by chance, we compare the difference of the logarithms with its standard error, namely  $\sqrt{\frac{1}{2 \times 141} + \frac{1}{110}}$ :

# ANOVA

Fisher & MacKenzie (1923)  
 Studies in crop variation II.  
 The manurial response of  
 different potato varieties  
*J. Agric. Sci.*

- 12 varieties × 2 dung (+, -) × 3 fertilizers (basal, sulphate, chloride)
- ignore block structure ( half-field / (plot \* row) )
- fits main effects of variety and manures, and their interaction tested by using approximate Normality of log(variance)
- then fits a multiplicative model (by eigenvalue decompositions)

# Analysis of variance

- Fisher (1934) Discussion to 'Statistics in agricultural research' *J. Roy. Statist. Soc., Suppl.*
  - "The analysis of variance is not a mathematical theorem, but rather a convenient method of arranging the arithmetic."
- Yates (1937) *Design and Analysis of Factorial Experiments*
  - Yates' algorithm for analysis of variance – orthogonal designs, one error term
- Wilkinson (1970) A general recursive algorithm for analysis of variance. *Biometrika*
  - non-orthogonal (balanced) designs, several error terms
- Payne & Wilkinson (1977). A general algorithm for analysis of variance. *Applied Statistics*
- Payne (1998). Detection of partial aliasing and partial confounding in generally balanced designs. *Comp. Statistics*

..

# Another tea test

Plate 5. At tea outside the Sample House at Rothamsted.

- could Dr B. Muriel Bristol tell whether milk had been poured first?
- Chapter II of *The Design of Experiments* (Fisher 1935)
  - used to illustrate concepts of randomization, significance, exact tests

••

# Significance tests

- Arbuthnot (1710) "Divine Providence had intervened in favour of the male sex"
  - probability  $1/2^{17}$  of more male than female births in London in 17 consecutive years
- Fisher (1935) *The Design of Experiments* Ch. II
  - Every experiment may be said to exist only in order to give the facts a chance of disproving the null hypothesis
- Yates "those damned stars"

..

- the first "damned stars"..?

# Significance tests

- Arbuthnot (1710) "Divine Providence had intervened in favour of the male sex"
  - probability  $1/2^{17}$  of more male than female births in London in 17 consecutive years
- Fisher (1935) *The Design of Experiments* Ch. II
  - Every experiment may be said to exist only in order to give the facts a chance of disproving the null hypothesis
- Yates "those damned stars"
- Payne quoted in Perry (1986) Multiple-comparison procedures a dissenting view. *J. Econ Entomol*
  - .. likened a significance test to the safety net of a tightrope walker: it helps give confidence (that unjustified conclusions are not being drawn from random errors in the data) but should not be part of the act

••

# Significance?

Output

Powell	Christie
9.74	9.87
9.77	9.91
9.77	9.92
9.77	9.96
9.78	9.97

**Mann-Whitney U (Wilcoxon rank-sum) test**

Variates: Powell, Christie.

Value of U: 0.0 (second sample has highest rank score).

Exact probability: 0.008  
(under null hypothesis that Powell is equal to Christie).

Sample sizes: 5, 5.

- 5 best 100m. times for Asafa Powell and Linford Christie
  - Powell is significantly faster
  - but would it matter if they wanted to run to catch a bus?
  - must consider *biological* as well as *statistical* significance!

# Randomization

- Fisher (1926) The arrangement of field experiments. *J. Min. Ag. G. Br.*
  - The estimate of error is valid because, if we imagine a large number of different results obtained by different random arrangements, the ratio of the real to the estimated error, calculated afresh for each of these arrangements, will be actually distributed in the theoretical distribution by which the significance of the result is tested.
  - i.e. randomization distribution should approximate Normal distribution
  - demonstrated by Eden & Yates (1933, *J. Agric. Sci*) with uniformity data
- very controversial at the time
  - systematic designs preferred e.g. Russell (1926) *J. Min. Ag. G. Br.* and Student (1936) *J. Roy. Statist. Soc. Suppl.*
- Bailey, Praeger, Rowley & Speed (1981) Generalized wreath products of permutation groups. *Proc. London Math. Soc.*
- Bailey (1983) Restricted randomization. *Biometrika*
  - how to rule out "unfortunate" randomizations

1971 - 1994	C. J. Dyer

- Boston Globe (1936)
  - "Fisher taught experimenters how to experiment."
- Fisher & Rothamsted taught Americans applied statistics
  - notice W.G. Cochran (1934-9) & O. Kempthorne (1941-9)
  - also many others on informal research visits

# Design of experiments

- Boston Globe (1936)
  - "Fisher taught experimenters how to experiment"
- Fisher (1926) introduced factorial design
  - "No aphorism is more frequently repeated in connection with field trials, than that we should ask nature few questions or, ideally, one question, at a time. The writer is convinced that this view is mistaken. Nature, he suggests, will best respond to a logical and carefully thought out questionnaire; indeed, if we ask her a single question, she will often refuse to answer until some other topic has been discussed."
  - if there is no interaction, we have combined several one-at-a-time expts
  - while, if there is an interaction, we are much wiser!
- Eden & Fisher (1927) Studies in crop variation IV The experimental determination of the value of top dressings with cereals *J. Agric. Sci.*
  - first of Fisher's design to be used in practice

# Variance components

- Fisher (1918) The correlation between relatives on the supposition of Mendelian inheritance. *Trans. Roy. Soc. Edinb.*
  - introduced concept of analysis of variance components
- Patterson & Thompson (1971) Recovery of inter-block information when block sizes are unequal. *Biometrika*
  - REML (residual/restricted maximum likelihood) for analysis of unbalanced designs and variance-component estimation
- Wilkinson, Eckert, Hancock & Mayo (1983) Nearest Neighbour (NN) Analysis of Field Experiments. *J. Roy. Statist. Soc. B*
- Gilmour, Thompson & Cullis (1995). Average Information REML, an efficient algorithm for variance parameter estimation in linear mixed models. *Biometrics*
- Gilmour, Cullis & Verbyla (1997). Accounting for natural extraneous variation in analysis of field experiments. *JABES*
- Verbyla, Cullis, Kenward & Welham (1997). The analysis of designed experiments and longitudinal data using smoothing splines. *Applied Statistics*

# REML – subnote

- also used in plant science
  - e.g. Baird, Johnstone, & Wilson (2004) Normalization of microarray data using a spatial mixed model analysis which includes splines. *Bioinformatics*
- providing a link to Fisher's interests in genetics (not discussed here)
  - R. Dawkins (1986) *The Blind Watchmaker* "the greatest of his [Darwin's] successors"
  - L.J. Savage (1976) *Annals of Statistics* "I occasionally meet geneticists who ask me whether it is true that the great geneticist R.A. Fisher was also an important statistician"

..

# Statistical computing

- Millionaire calculating machine
  - bought by Fisher at a cost  $>£200$
  - used here by his successor Frank Yates (Head of Department 1933-1968)
  - Fisher: "most of my statistics has been learned on the machine"

..

# Statistical computing – later work

Elliott-NRDC 401 electronic computer

- Elliot 401 computer installed at Rothamsted in 1954
  - Gower (1985) "first computer to be associated primarily with agricultural research and with statistics"
  - Yates (1955) "Having an electronic machine on the spot has made all the difference to developing its applications to research statistical problems"

# Statistical computing – later work

The screenshot displays the GenStat software interface. The main window shows the 'Output' window with the following text:

```
38 "Two-way design in randomized blocks"  
39 DELETE [REDEFINE=yes] _ibalance  
40 A2WAY [PRINT=aovtable,means; TREATMENTS=N,S; BLOCKS=block; FA  
41 PSE=diff; PLOT=*; EXIT=_ibalance] yield; SAVE=_a2save
```

Below this is the 'Analysis of variance' table:

Variate: yield	d.f.	s.s.	m.s.	v.r.
block stratum	2	0.30850	0.15425	3.44
block.*Units* stratum				
N	2	4.59223	2.29611	51.22
S	3	0.97720	0.32573	7.27
N.S	6	0.64851	0.10808	2.41
Residual	22	0.98625	0.04483	
Total				

Below the ANOVA table is the 'Tables of means' section:

Variate: yield

Grand mean 1.104

	N	S
0.	0.601	0.829

The 'One- and two-way Analysis of Variance' dialog box is open, showing 'Design' set to 'Two-way', 'Y-variate' as 'yield', 'Treatment 1' as 'N', 'Treatment 2' as 'S', and 'block' as the blocking factor. The 'Include interaction' checkbox is checked.

The 'Spreadsheet [Canola.gsh]' window shows a table with columns 'block', 'N', 'S', and 'yield':

Row	block	N	S	yield
1	1	0	0	0.7496
2	1	180	20	1.5961
3	1	230	0	0.7995

The 'GenStat Graphics Viewer - Means for S at d...' window displays a line graph titled 'Means for S at different levels of N'. The x-axis is labeled 'S' with values 3, 10, 23, and 40. The y-axis ranges from 0.8 to 1.6. Three lines are plotted: a black line with 'x' markers, a red line with '+' markers, and a green line with '+' markers. The black line shows a peak at S=10 and then a slight decline. The red and green lines show an overall increasing trend with S.

- *GenStat for Windows*

- written by Rothamsted since 1968 (and now VSN) to develop and distribute statistical methodology and research
- see [www.vsni.co.uk](http://www.vsni.co.uk) (or the Agronomix Stand)..

# Symbiosis - stats and agriculture

- the problems posed by the agricultural and biological research at Rothamsted have spurred many advances in statistics
  - tradition started by Fisher, and continued ever since
  - we have helped you, but you have helped us!
- Fisher recommended full statistical involvement
  - "To consult the statistician after an experiment is finished is often merely to ask him to conduct a *post mortem* examination. He can perhaps say what the experiment died of." Presidential Address to the First Indian Statistical Congress, 1938.
- see e.g. Bailey & Payne: Experimental design: statistical research and its application. *Institute of Arable Crops Research Report for 1989*

# R.A. Fisher

- *"The Statistics Department had its origin in the appointment of R.A. Fisher in 1919 to study the accumulated results of the classical field experiments. Fisher soon realised the need for improved statistical techniques over the whole range of agricultural and biological research, and the groundwork for modern statistics was laid by him during the 1920s and 1930s."*
  - Anon (1971) *Rothamsted Experimental Station, Field Experiments and the Work of the Departments.*
- for more information, see Joan Fisher Box (1978) *R.A. Fisher The Life of a Scientist*
